## **1 PROBLEM STATEMENT**

---

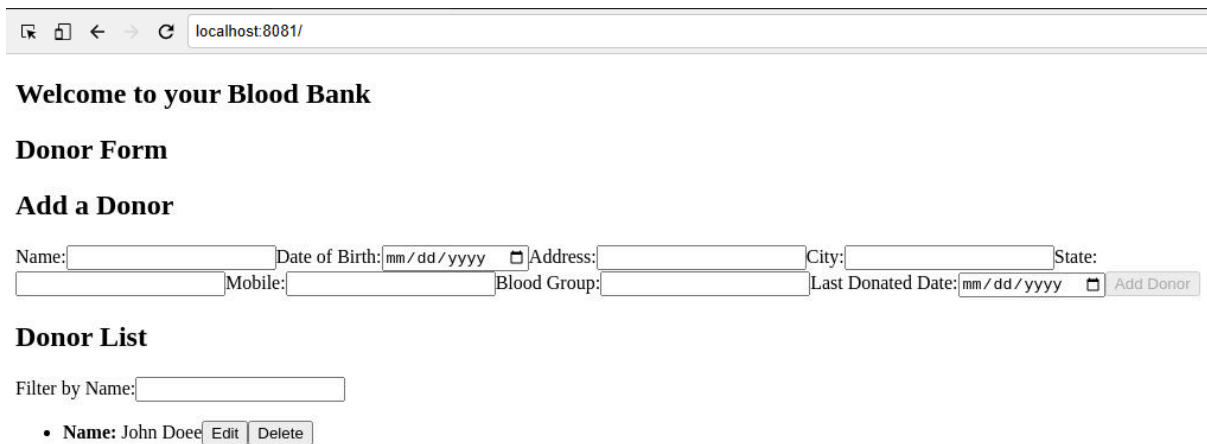

"Blood Bank Application" is a Single Page Application (SPA) that empowers users to have a record of all bank donors with multiple details address, blood group and contact details.

## 2 PROPOSED BLOOD BANK APPLICATION WIREFRAME

---

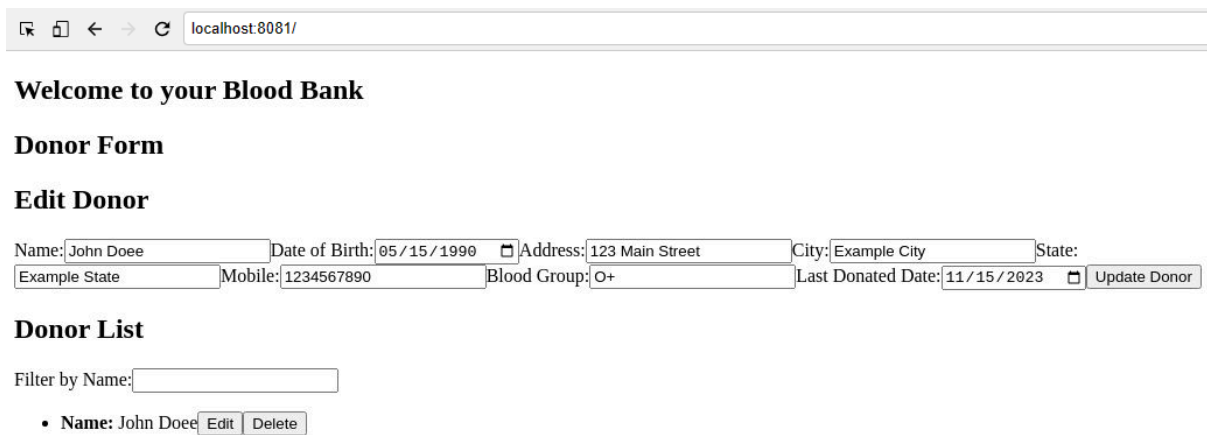

UI needs improvisation and modification as per given use case and to make test cases passed.

### 2.1 WELCOME PAGE

A browser window mockup showing the 'Welcome to your Blood Bank' page. The page has a header with the title 'Welcome to your Blood Bank'. Below the header is a section titled 'Donor Form' with a sub-header 'Add a Donor'. The form contains input fields for Name, Date of Birth (with a date picker icon), Address, City, State, Mobile, Blood Group, and Last Donated Date (with a date picker icon). An 'Add Donor' button is at the bottom right of the form. Below the form is a 'Donor List' section with a 'Filter by Name:' input field. A single donor entry is shown: 'Name: John Doe' with 'Edit' and 'Delete' buttons.

### SCREEN SHOTS

A browser window mockup showing the 'Edit Donor' page. The page has a header with the title 'Welcome to your Blood Bank'. Below the header is a section titled 'Donor Form' with a sub-header 'Edit Donor'. The form contains input fields for Name (pre-filled with 'John Doe'), Date of Birth (pre-filled with '05/15/1990' and a date picker icon), Address (pre-filled with '123 Main Street'), City (pre-filled with 'Example City'), State (pre-filled with 'Example State'), Mobile (pre-filled with '1234567890'), Blood Group (pre-filled with 'O+'), and Last Donated Date (pre-filled with '11/15/2023' and a date picker icon). An 'Update Donor' button is at the bottom right of the form. Below the form is a 'Donor List' section with a 'Filter by Name:' input field. A single donor entry is shown: 'Name: John Doe' with 'Edit' and 'Delete' buttons.

### 3 BUSINESS-REQUIREMENT:

---

As an application developer, develop the Blood Bank Application (Single Page App) with below guidelines:

User Story #	User Story Name	User Story
US_01	Welcome Page	<p>As a user I should be able to visit the welcome page as default page.</p> <p>Acceptance criteria:</p> <ol style="list-style-type: none"><li>1. Users should be able to see a form to add a new donor.</li><li>2. Users should be able to see the list of all donors.</li><li>3. It must have Name, Date of Birth, Address, City, State, Mobile, Blood Group &amp; Last Donated Date with Add Donor button.</li><li>4. List should have an Edit and Delete button to edit and delete a donor respectively.</li></ol>

### 4 VALIDATIONS

---

- All required fields must be fulfilled with valid data.
- In the starting “Add Donor” button should be disabled.
- Only after validating fields, “Add Donor” button should be enabled.
- Once we click on “Add Donor”, a new donor must be added to the list.

### 5 CONSTRAINTS

---

- You should be able to press the “TAB” key and “SHIFT + TAB” to navigate from top field to bottom field and vice-versa.
- On clicking the “Add Donor” button, a new donor must be added with entered fields.
- “Add Donor” button will be disabled until all validations are fulfilled.

## 6 MANDATORY ASSESSMENT GUIDELINES

---

1. All actions like build, compile, running application, running test cases will be through Command Terminal.
2. To open the command terminal the test takers, need to go to Application menu (Three horizontal lines at left top) -> Terminal ->New Terminal.
3. This editor Auto Saves the code.
4. If you want to exit(logout) and continue the coding later anytime (using Save & Exit option on Assessment Landing Page) then you need to use CTRL+Shift+B-command compulsorily on code IDE. This will push or save the updated contents in the internal git/repository. Else the code will not be available in the next login.
5. These are time bound assessments the timer would stop if you logout and while logging in back using the same credentials the timer would resume from the same time it was stopped from the previous logout.
6. To test any Restful application, the last option on the left panel of IDE, you can find ThunderClient, which is the lightweight equivalent of POSTMAN.
7. This is a web-based application, to run the application on a browser, use the internal browser in the workspace. Click on the second last option on the left panel of IDE, you can find Browser Preview, where you can launch the application.

**Note: The application will not run in the local browser**

8. You can follow series of command to setup React environment once you are in your project-name folder:
  - a. npm install -> Will install all dependencies -> takes 10 to 15 min
  - b. npm run start -> To compile and deploy the project in browser. You can press <Ctrl> key while clicking on localhost:8080/8081 to open project in browser -> takes 2 to 3 min
  - c. npm run json-start -> As we are using a json server to mimic our db.json file as a database. So, this command is useful to start a json server.

- a. `npm run jest` -> to run all test cases and see the summary. It takes 5 to 6 min to run.
  - d. `npm run test` -> to run all test cases. **It is mandatory to run this command before submission of workspace** -> takes 5 to 6 min
9. You may also run “`npm run jest`” while developing the solution to refactor the code to pass the test-cases.
10. Once you are done with development and ready with submission, you may navigate to the previous tab and submit the workspace. It is mandatory to click on **“Submit Assessment”** after you are done with code.
11. You need to use `CTRL+Shift+B` - command compulsorily on code IDE, before final submission as well. This will push or save the updated contents in the internal git/repository, and will be used to evaluate the code quality.
